## AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

## LISTING OF CLAIMS:

Claims 1-14 (canceled).

15. (currently amended): A gas sensor comprising:

a to-be-held member including a distal-end-side holding surface and a proximal-end-side holding surface located on the proximal end side with respect to the distal-end-side holding surface;

a tubular metallic shell including a stepped portion projecting radially inward from its inner circumferential surface, and adapted to hold the to-be-held member therein while surrounding the to-be-held member from radially outside and supporting the distal-end-side holding surface of the to-be-held member by a support surface of the stepped portion; and

a first metallic packing abutting the proximal-end-side holding surface of the to-be-held member and the inner circumferential surface of the metallic shell, wherein

the first packing is disposed in an acute-angle clearance formed between the proximalend-side holding surface of the to-be-held member and the inner circumferential surface of the metallic shell such that the first packing has a wedge-like cross section and is pressed against the proximal-end-side holding surface of the to-be-held member and the inner circumferential surface of the metallic shell, and

U.S. Appln. No.: 10/564,354

the first packing is formed by axially pressing and plastically deforming a wire packing, which has been inserted into the clearance between the proximal-end-side holding surface of the to-be-held member and the inner circumferential surface of the metallic shell, such that the first packing has a wedge-like cross-section.

- 16. (previously presented): A gas sensor according to claim 15, wherein the to-beheld member is a gas detection element having a projection which includes the distal-end-side holding surface and the proximal-end-side holding surface and which projects radially outward, the gas detection element assuming a closed-bottomed tubular shape with an axially distal end closed.
- 17. (previously presented): A gas sensor according to claim 15, further comprising a gas detection element extending along the axial direction, wherein the to-be-held member is an element holder which has the distal-end-side holding surface, the proximal-end-side holding surface, and an opening through which the gas detection element is passed.
- 18. (previously presented): A gas sensor according to claim 16, further comprising a charged seal layer, which is formed by means of charging a powder into a clearance between the outer circumferential surface of the gas detection element and the inner circumferential surface of the metallic shell in a region located toward the proximal end of the gas sensor with respect to the first packing.
- 19. (previously presented): A gas sensor according to claim 17, further comprising a charged seal layer, which is formed by means of charging a powder into a clearance between the outer circumferential surface of the gas detection element and the inner circumferential surface

U.S. Appln. No.: 10/564,354

of the metallic shell in a region located toward the proximal end of the gas sensor with respect to

the first packing.

20. (previously presented): A gas sensor according to claim 15, wherein the first

packing is formed by axially pressing and plastically deforming a wire packing, which has been

inserted into the clearance between the proximal-end-side holding surface of the to-be-held

member and the inner circumferential surface of the metallic shell, such that the first packing has

a wedge-like cross section.

21. (previously presented): A gas sensor according to claim 15, wherein

the proximal-end-side holding surface of the to-be-held member and the inner

circumferential surface of the metallic shell assume respective shapes such that in at least a

distal-end-side portion of the clearance, the angle formed by the proximal-end-side holding

surface and the inner circumferential surface decreases toward the distal end side; and

the first packing is disposed to extend to the portion of the clearance where the angle

formed by the proximal-end-side holding surface and the inner circumferential surface decreases

toward the distal end side.

22. (currently amended): A gas sensor comprising:

a gas detection element assuming a closed-bottomed tubular shape with an axially distal

end closed, including an outer electrode formed on its outer circumferential surface, and

including a projection projecting radially outward;

a tubular metallic shell including a stepped portion projecting radially inward from its

inner circumferential surface, and adapted to hold the gas detection element therein while

AMENDMENT UNDER 37 C.F.R. § 1.111

U.S. Appln. No.: 10/564,354

surrounding the gas detection element from radially outside and supporting a distal end surface of the projection by a support surface of the stepped portion, the support surface of the stepped

portion abutting the outer electrode formed on the distal end surface of the projection to thereby

be electrically connected with the outer electrode; and

a first metallic packing abutting a proximal end surface of the projection and the inner

circumferential surface of the metallic shell, wherein

the first packing is disposed in an acute-angle clearance formed between the proximal

end surface of the projection and the inner circumferential surface of the metallic shell such that

the first packing has a wedge-like cross section and is pressed against the proximal end surface

of the projection and the inner circumferential surface of the metallic shell, and

the first packing is formed by axially pressing and plastically deforming a wire packing,

which has been inserted into the clearance between the proximal end surface of the projection

and the inner circumferential surface of the metallic shell, such that the first packing has a

wedge-like cross section.

23. (previously presented): A gas sensor according to claim 22, further comprising a

charged seal layer, which is formed by means of charging a powder into a clearance between the

outer circumferential surface of the gas detection element and the inner circumferential surface

of the metallic shell in a region located toward the proximal end of the gas sensor with respect to

the projection of the gas detection element.

24. (currently amended): A gas sensor according to elaims-claim 22, the first packing

is made of metal and abuts the outer electrode formed on the proximal end surface of the

AMENDMENT UNDER 37 C.F.R. § 1.111

U.S. Appln. No.: 10/564,354

projection and the inner circumferential surface of the metallic shell to thereby electrically connect the outer electrode and the metallic shell.

25. (canceled).

(previously presented): A gas sensor according to claim 22, wherein the proximal 26.

end surface of the projection and the inner circumferential surface of the metallic shell assume

respective shapes such that in at least a distal-end-side portion of the clearance, the angle formed

by the proximal end surface and the inner circumferential surface decreases toward the distal end

side; and

the first packing is disposed to extend to the portion of the clearance where the angle

formed by the proximal end surface and the inner circumferential surface decreases toward the

distal end side.

27. (currently amended): A gas sensor comprising:

a gas detection element assuming a closed-bottomed tubular shape with an axially distal

end closed, including an outer electrode formed on its outer circumferential surface, and having a

projection projecting radially outward;

a tubular metallic shell including a stepped portion projecting radially inward from its

inner circumferential surface, and adapted to hold the gas detection element therein while

surrounding the gas detection element from radially outside and supporting a distal end surface

of the projection by a support surface of the stepped portion;

a first metallic packing abutting a proximal end surface of the projection and the inner

circumferential surface of the metallic shell; and

U.S. Appln. No.: 10/564,354

a second packing of metal disposed between the distal end surface of the projection and

the support surface of the stepped portion, and abutting the support surface of the stepped portion

and the outer electrode formed on the distal end surface of the projection to thereby electrically

connect the metallic shell and the outer electrode, wherein

the first packing is disposed in an acute-angle clearance formed between the proximal

end surface of the projection and the inner circumferential surface of the metallic shell such that

the first packing has a wedge-like cross section and is pressed against the proximal end surface

of the projection and the inner circumferential surface of the metallic shell, and

the first packing is formed by axially pressing and plastically deforming a wire packing,

which has been inserted into the clearance between the proximal end surface of the projection

and the inner circumferential surface of the metallic shell, such that the first packing has a

wedge-like cross section.

28. (previously presented): A gas sensor according to claim 27, further comprising a

charged seal layer, which is formed by means of charging a powder into a clearance between the

outer circumferential surface of the gas detection element and the inner circumferential surface

of the metallic shell in a region located toward the proximal end of the gas sensor with respect to

the projection of the gas detection element.

29. (currently amended): A gas sensor according to claim 27, the first packing is

made of metal and abuts the outer electrode formed on the proximal end surface of the projection

and the inner circumferential surface of the metallic shell to thereby electrically connect the outer

electrode and the metallic shell.

U.S. Appln. No.: 10/564,354

30. (canceled).

31. (previously presented): A gas sensor according to claim 27, wherein the proximal

end surface of the projection and the inner circumferential surface of the metallic shell assume

respective shapes such that in at least a distal-end-side portion of the clearance, the angle formed

by the proximal end surface and the inner circumferential surface decreases toward the distal end

side; and

the first packing is disposed to extend to the portion of the clearance where the angle

formed by the proximal end surface and the inner circumferential surface decreases toward the

distal end side.

32. (currently amended): A method of manufacturing a gas sensor comprising:

a gas detection element assuming a closed-bottomed tubular shape with an axially distal

end closed, including an outer electrode formed on its outer circumferential surface, and

including a projection projecting radially outward;

a tubular metallic shell including a stepped portion projecting radially inward from its

inner circumferential surface, and adapted to hold the gas detection element therein while

surrounding the gas detection element from radially outside and supporting a distal end surface

of the projection by a support surface of the stepped portion, the support surface of the stepped

portion abutting the outer electrode formed on the distal end surface of the projection to thereby

be electrically connected with the outer electrode; and

a first metallic packing abutting a proximal end surface of the projection and the inner

circumferential surface of the metallic shell,

Attorney Docket No.: Q91857

AMENDMENT UNDER 37 C.F.R. § 1.111

U.S. Appln. No.: 10/564,354

the method comprising:

an element-inserting step of inserting the gas detection element into the metallic shell;

a wire-packing-inserting step of inserting a wire packing, which is to become the first

packing, into the metallic shell; and

a first-packing-forming step of axially pressing the wire packing inserted into the metallic

shell such that the wire packing is plastically deformed so as to form the first packing which is

disposed in an acute-angle clearance formed between the proximal end surface of the projection

and the inner circumferential surface of the metallic shell such that the first packing has a wedge-

like cross section and is pressed against the proximal end surface of the projection and the inner

circumferential surface of the metallic shell.

(currently amended): A method of manufacturing a gas sensor, said gas sensor 33.

comprising:

a gas detection element assuming a closed-bottomed tubular shape with an axially distal

end closed, having an outer electrode formed on its outer circumferential surface, and including a

projection projecting radially outward;

a tubular metallic shell including a stepped portion projecting radially inward from its

inner circumferential surface, and adapted to hold the gas detection element therein while

surrounding the gas detection element from radially outside and supporting a distal end surface

of the projection by a support surface of the stepped portion;

a first metallic packing abutting a proximal end surface of the projection and the inner

circumferential surface of the metallic shell; and

AMENDMENT UNDER 37 C.F.R. § 1.111

U.S. Appln. No.: 10/564,354

a second packing of metal disposed between the distal end surface of the projection and the support surface of the stepped portion, and abutting the outer electrode formed on the distal end surface of the projection and the support surface of the stepped portion to thereby electrically connect the outer electrode and the metallic shell,

the said method comprising:

a second-packing-inserting step of inserting the second packing into the metallic shell;

an element-inserting step of, after the second-packing-inserting step, inserting the gas detection element into the metallic shell;

a second-packing-pressing step of, after the element-inserting step, axially pressing the gas detection element and the second packing inserted into the metallic shell to thereby bring the second packing into close contact with the support surface of the stepped portion;

a wire-packing-inserting step of, after the second-packing-pressing step, inserting a wire packing, which is to become the first packing, into the metallic shell; and

a first-packing-forming step of axially pressing the wire packing inserted into the metallic shell such that the wire packing is plastically deformed so as to form the first packing which is disposed in an acute-angle clearance formed between the proximal end surface of the projection and the inner circumferential surface of the metallic shell such that the first packing has a wedgelike cross section and is pressed against the proximal end surface of the projection and the inner circumferential surface of the metallic shell.
